

The WTC-2 WOLF TERMINATOR is designed to eliminate the stuttering or warbling note often found in the D₃ to G₃ range when played on the cello. This problem often occurs on the G and C strings and may sometimes be found on the D string as well. When tuned to the frequency of the wolf note, the WOLF TERMINATOR will enable the note to be played smoothly and with complete control. In addition, selective placement of the WOLF TERMINATOR on the cello top will produce effective suppression of the wolf with minimal effect on the overall tone.

INSTALLATION INSTRUCTIONS

1. Locate the wolf note

Play your cello on the G string to locate the **precise** position of the wolf note. It will probably occur somewhere between two notes rather than exactly on a single note. On most cellos you will usually hear it between E and F#, but yours could be anywhere between D and G. On your own cello you are no doubt familiar with the note(s) which are affected by the wolf, but since the goal is to **eliminate** the wolf, rather than simply moving it between two notes or making it less noticeable, locating the precise position is important.

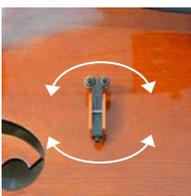

2. Prepare the WOLF TERMINATOR for installation

Attach a small amount of the provided removable adhesive to the base of the WOLF TERMINATOR. Roll it between your fingers into a noodle as long as the base, as shown in the photo, and press it on.

Save the unused portion of the removable adhesive for future use.

3. Mount the WOLF TERMINATOR (temporary position)

The WOLF TERMINATOR should be placed about an inch away from the tailpiece and even with the upper end. For most instruments, this will be a temporary position which allows easier identification of the wolf and convenient access to the frequency adjusting screw. Press slowly but firmly onto the top of the cello, using a slight back and forth twisting motion. Hold the body of the WOLF TERMINATOR at the upper corners of the body and avoid touching the metal blades.

4. Eliminate the wolf note

Play the wolf note (located in step 1) and listen for the severity of the wolf. Adjust the eliminator by using the supplied allen wrench. Insert the "ball end" of the wrench into the adjustment screw, taking care not to scratch the cello. Steady the body of the eliminator with one hand and turn the wrench with the other. Turn the screw a half turn at a time, testing for the wolf each half turn. Count the turns. If the wolf hasn't changed after reaching the limits of adjustment (regardless of direction), return to the original position and adjust in the opposite direction. The wolf note will noticeably

diminish and disappear when the eliminator is tuned to the exact frequency of the wolf. Finally, search for the wolf note, both above and below the original frequency, to be sure that the wolf is gone. If you had a really bad wolf which affected several notes, you can adjust the eliminator to achieve the best balance between all affected notes.

NOTE: The WOLF TERMINATOR has been shipped with the frequency adjuster preset at approximately F. When looking at the end of the frequency adjusting screw, observe that clockwise turns will lower the frequency toward D, and counterclockwise turns will raise the frequency toward G.

The rough adjustments can be done a half turn at a time. When you have localized the tuning, further adjustment can be done by a quarter turn at a time. Confirm your adjustments by playing passages in your normal style.

When the frequency adjuster is turned clockwise as far as it will go, the WOLF TERMINATOR will be tuned to the D range. When the adjusting screw is turned counterclockwise as far as it will go, the Wolf Terminator will be tuned to the G range. Most cellos will require tuning in the middle of the range at E to F#. Caution: do not force the adjusting screw beyond these limits as this may cause permanent damage!

You may find it easier to tune the WOLF TERMINATOR by playing the wolf note on the C string. Because the wolf note is much more pronounced on the C string and requires more critical tuning of the WOLF TERMINATOR, suppression of the wolf on the C string may produce more accurate results in less time. Recheck for the wolf note on the G string and readjust as necessary to achieve the best compromise between the two strings.

If you have a friend available to help, you can have your friend adjust the WOLF TERMINATOR while you continuously play the wolf note. You will hear the wolf note gradually diminish and disappear... all in less than a minute.

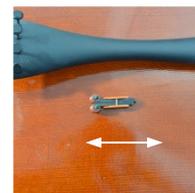

5. Move the WOLF TERMINATOR to its permanent position

Once you have achieved success with eliminating the wolf, you can move the WOLF TERMINATOR to a less visible position. You can reduce the amount of suppression to the exact amount needed to counter the wolf *and* minimize the eliminator's effect on the overall tone of the cello. This is accomplished by moving the eliminator toward the tailpiece and/or downward toward the lower end of the cello. Remove the eliminator by lifting up slowly while twisting back and forth. Any

pieces of the removable putty which remain on the cello can be removed by rolling a finger over the pieces until they form into a ball which can then be lifted off and pressed back onto the base of the eliminator.

Reattach the eliminator so that it is even with the outside of the tailpiece and an inch below its upper edge. The tuning of the eliminator may have to be adjusted slightly. Play the cello and adjust if necessary. In stages, try moving the eliminator slightly further beneath the tailpiece and/or down toward the lower end of the cello. With each successive step, listen for wolfs and readjust as required. Go back to the previous location if the wolf reappears. Because each cello will react differently to the WOLF TERMINATOR, you may have to try several positions in order to find the best compromise between wolf suppression, visual appearance, and overall tone.

The photos above show some of the possible permanent positions for the WOLF TERMINATOR. The device may be oriented either crosswise or lengthwise with the frequency adjustment screw facing in any direction. The orientation of the eliminator may affect the frequency adjustment, however, so if you remove the eliminator and later reattach it to your cello, be sure to place it in exactly the same spot and with the same orientation.

Additional notes and observations

Cello wolf notes may vary in frequency and intensity due to seasonal and weather changes. In addition, changes to the instrument due to maintenance and setup - including replacement or adjustments to the soundpost, bridge, strings and tailpiece- will also affect wolfs. Because the WOLF TERMINATOR is easily tuned, corrections can be quickly and effectively made. Occasionally check to see that the body of the eliminator has not loosened from the top. There are several small screws on the eliminator which are shop adjusted and permanently set. The only adjustment to be made by the player is the single (frequency) adjustment screw at the end of the device.

Moving the Wolf Terminator between two cellos can be easily done because of the adjustable tuning feature and the use of the removable adhesive. Keep in mind, however, that because the body resonances of a cello interact with the tuning of the WOLF TERMINATOR, it is impossible to calibrate the WOLF TERMINATOR note by note. The frequency adjustment to suppress an F wolf on one cello will probably require a little retuning to suppress the same F wolf on another instrument. The WOLF TERMINATOR may also be removed when not required. When needed, just place it back with the same position and orientation as before.

Model WTC-2 with WTA Adaptor for cello: 2-6-17

This new version of the cello Wolf Terminator, the WTC-2, has an exciting new feature - the ability to install it internally and still retain all of the adjustable features of the original model! In addition, the WTC-2 can be easily removed at any time without damage to the cello. Complete detailed instructions for internal installation are on the reverse side of this page, and are also available on our website at: wolfterminator.com
